

## *Battery care*

Your Byocycle bike is equipped with a powerful, high quality lithium ion (polymer) battery. Lithium ion (polymer) is recognised as being the very best type of battery for electric bicycle use.

All lithium ion batteries must be well cared for to optimise useful life and range. It is the responsibility of the bike owner/operator to ensure the battery is looked after properly. A well maintained battery may give more than five years everyday service.

If a battery is not cared for as per our instructions it will not reach it's optimum performance and may not be covered by our warranty.

## *Battery care instructions*

- Never leave a battery completely depleted or drained for more than 24 hours.
- Always recharge the battery when possible even after a short journey.
- During long periods of storage and non-use keep the battery about 2/3 full and top up with a two-hour charge every eight weeks.
- Only use the charger supplied with the bike or a replacement from Byocycle.
- Keep the battery in a dry room.
- For optimum power and range keep battery in a warm room above 15 degrees c.

All batteries claimed under warranty will be tested to ensure they have been maintained as per our instructions.
